MNNIT ALLAHABAD

PLACEMENT GUIDE

Recruitment trends, statistics, preparation strategy, strengths and limitations

DATA QUALITY NOTE: Some years' institute-wide figures are not consistently verified in this document. Officially sourced figures are labelled as such; any illustrative values are explicitly marked as dummy data and must not be presented to users as actual outcomes.

Prepared for a college-information chatbot / retrieval-augmented generation (RAG) knowledge base.

1. Executive overview

Motilal Nehru National Institute of Technology Allahabad (MNNIT Allahabad), Prayagraj, has an institute Training and Placement Office (TPO) that coordinates campus recruitment, employer interaction, pre-placement talks, tests and interviews. Outcomes vary materially by branch, cohort, eligibility rules, hiring market and individual preparation. A chatbot should avoid treating a single headline package as representative of every student.

Quick facts (verify before each recruitment season)

Topic	Knowledge-base summary
Placement coordination	Institute Training and Placement Office (TPO)
Typical process	Company registration → eligibility screening → pre-placement talk → tests/interviews → offer and joining formalities
What students should compare	Branch-wise placement rate, median CTC, average CTC, number eligible/registered, and higher-studies count
Official starting point	TPO placement brochure and institute website; links listed in Sources section

2. Five-year trend: how to interpret the data

The table below intentionally separates verified figures from missing historical data. Public summaries sometimes mix graduating-year outcomes with the year a report was published. Do not merge those periods without checking the underlying NIRF or TPO report.

Graduating year / reporting period	Metric available in sources reviewed	Status / chatbot treatment
2021	No consistent verified institute-wide B.Tech series included here	Missing — do not infer
2022	No consistent verified institute-wide B.Tech series included here	Missing — do not infer
2023	No consistent verified institute-wide B.Tech series included here	Missing — do not infer
2024	NIRF-referenced summary: 968 B.Tech students placed out of 1,050 eligible; median salary ■12.0 LPA	Reported secondary summary; verify original NIRF file before quoting
2025	NIRF 2026-referenced summary: 966 UG 4-year students placed; median salary ■12.60 LPA	Reported secondary summary; check cohort/definition before comparing

Important: These 2024 and 2025 figures are not guaranteed to be perfectly comparable because reporting definitions and eligible-student denominators can differ. The 2025 source also reports course-wise/branch-wise numbers that may use a different subset.

3. Recent placement snapshot (reported figures; check original reports)

Measure	2024 (reported)	2025 (reported)
B.Tech students placed	968	966 UG 4-year students
Eligible students	1,050	Not stated in the same summary
Median salary	■12.0 LPA	■12.60 LPA
Interpretation	High placement volume; denominator matters	Median rose modestly in this reported series

A secondary placement summary for 2025 lists B.Tech average CTC at ■20.43 LPA and highest CTC at ■72 LPA. It also lists branch-specific results, including CSE placement rate of 96.75% and average CTC of ■27.72 LPA, but the chatbot should attach the reporting year and source every time it repeats these numbers.

4. Branch-wise variation

Placement outcomes are not uniform. In the reported 2025 summary, CSE and some circuital branches show stronger salary figures, while core branches can have a different mix of recruiters, job functions and hiring volumes. Branch-level figures are especially sensitive to small cohort sizes and unusually high offers.

Branch (reported 2025 summary)	Average CTC	Maximum CTC	Placement rate
Computer Science & Engineering	■27.72 LPA	■72 LPA	96.75%
Electronics & Communication Engineering	■22.98 LPA	■72 LPA	81.82%
Electrical Engineering	■22.14 LPA	■63.78 LPA	79.49%
Mechanical Engineering	■10.41 LPA	■63.78 LPA	83.19%
Civil Engineering	■8.15 LPA	■17.37 LPA	57.50%

These are secondary-source reported figures, not independently audited here. Maximum CTC is an outlier-prone metric; median, placement rate and number eligible give a more balanced view.

5. Strengths and limitations

Potential strengths

• Established institute-level TPO and structured recruitment coordination.
• Recruiter access across software, analytics, consulting, core engineering, manufacturing and other sectors, depending on the season.
• Alumni network and peer preparation can help students learn about roles and interview patterns.
• Strong outcomes in some branches and years can create opportunities for internships and full-time roles.

Potential limitations / caveats

• Outcomes differ sharply by branch, market cycle, academic eligibility and individual skill set.
• Headline highest package is not a typical salary and may represent one student or a specific compensation structure.
• CTC can include variable pay, stock, joining bonuses or benefits; it is not the same as monthly take-home pay.
• Some companies may restrict attempts, CGPA, backlogs or branch eligibility; policies change by recruiter.
• Students seeking non-software core roles may face a different employer mix and hiring volume.

6. Typical campus recruitment workflow

1) Read the TPO notice and confirm eligibility. 2) Register before the deadline. 3) Attend the pre-placement talk and understand role, location, bond, compensation and selection stages. 4) Complete online assessment or coding test. 5) Attend technical, case, group or HR interviews as applicable. 6) Follow offer acceptance and joining instructions. Always follow the current official notice: a previous year's process is only a guide.

7. Preparation plan for students

Timeline	Recommended work
First / second year	Build programming fundamentals, communication, one or two projects, and explore domains.
Before internship season	Prepare a one-page resume; practise aptitude, coding, core subjects and project explanation.
8–12 weeks before placements	Set a weekly DSA plan, revise CS fundamentals (OS, DBMS, networks, OOP), mock interviews and timed assessments.
During placement season	Track eligibility and deadlines, maintain a role-specific resume, research the company and ask clarifying questions.
After an offer	Read compensation breakup, role, location, joining date, service agreement and conditions carefully.

8. FAQs for the chatbot

Q: What is the average package at MNNIT?
A: It depends on the graduating year, programme and branch. Ask which branch and cohort the student means, then provide average and median separately with a source and year.

Q: Is CSE placement better than core branches?
A: Reported outcomes vary by year. CSE often has strong software hiring, but individual outcomes depend on skills, eligibility and market demand. Compare branch-wise placement rate and median rather than relying only on maximum CTC.

Q: Does everyone get placed?
A: No placement outcome is guaranteed. Eligibility, student participation, market conditions and recruiter decisions affect outcomes.

Q: What is the highest package?
A: A secondary summary reports ■72 LPA for 2025, but highest CTC is not representative of a typical offer. Verify the current TPO report before quoting.

Q: Where can I verify the latest numbers?
A: Check the official TPO website and the institute's NIRF/annual-report documents. Use the reporting year and cohort definition when comparing.

9. Sources and data provenance

• Official MNNIT TPO Placement Brochure 2026: https://tpo.mnnit.ac.in/tnp/downloads/Placement%20Brochure%20MNNIT-Allahabad_2026.pdf
• Official MNNIT website: https://mnnit.ac.in/
• Secondary placement summary used for reported 2024–2025 figures: Careers360 MNNIT Allahabad placements page (consult and verify original institute/NIRF reports before deployment).

Chatbot ingestion rule: preserve source URL, publication/reporting year, cohort, programme, metric definition and confidence. If a value is missing, say so instead of filling it with a guess.
